

Lehmer-Clements rank-LCM pruning: the gapless search space vanishes with omega

Search space vanishes while D -count explodes

The signal: survivors collapse monotonically

Survivors (discriminants passing all pruning): 71,66,53,47,30,26,9,4,3,2 for omega=8..17 -- strictly decreasing. Only omega=8 yielded a pair (633555). Total discriminants grow as 2^ω ; survival rate falls faster.
